**Interim Review**

# Introduction

The International Business Machines Corporation (IBM) is an American multinational technology company headquartered in Armonk, New York, United States, with operations in over 170 countries. IBM manufactures and markets computer hardware, middleware and software, and provides hosting and consulting services in areas ranging from mainframe computers to nanotechnology.

IBM aims to bring Businesses closer and smarter than ever with the help of their state of the art enterprise software product called B2B Sterling Integrator. IBM B2B Integrator helps companies integrate complex B2B (Business to Business) / EDI (Electronic Data Exchange) processes with their partner communities. IBM aims to transform the B2B Sterling product into Microservice architecture.

## Brief Overview

Until now, I have completed several tasks pertaining to the B2Bi Sterling Integrator. Proceeding in stages, Firstly, I researched about the microservice architecture and Business-to-Business processes. Secondly, I understood the basics of Business Process Modelling language (BPML). BPML is an XML standard to write business process. I gave a presentation regarding the application of microservice architecture to my team. To experiment further with the microservice software development architecture, I developed two Microservices – One on node.js (Backend Service) and other using Java JSP (Frontend Service). Then, I established a REST API connection channel between both services. Lastly, I got myself acquainted with the Sterling Integrator product and deployed a Sample WAR (Web Application Archive) file on this platform. I also got access to the B2B Sterling Integrator code repository and I explored the code structure to build services and deploy onto this platform.

## Report on the Present Investigation

(Progress until the Interim review)

### Task 1: Researching about Microservice Architecture and B2B Processes

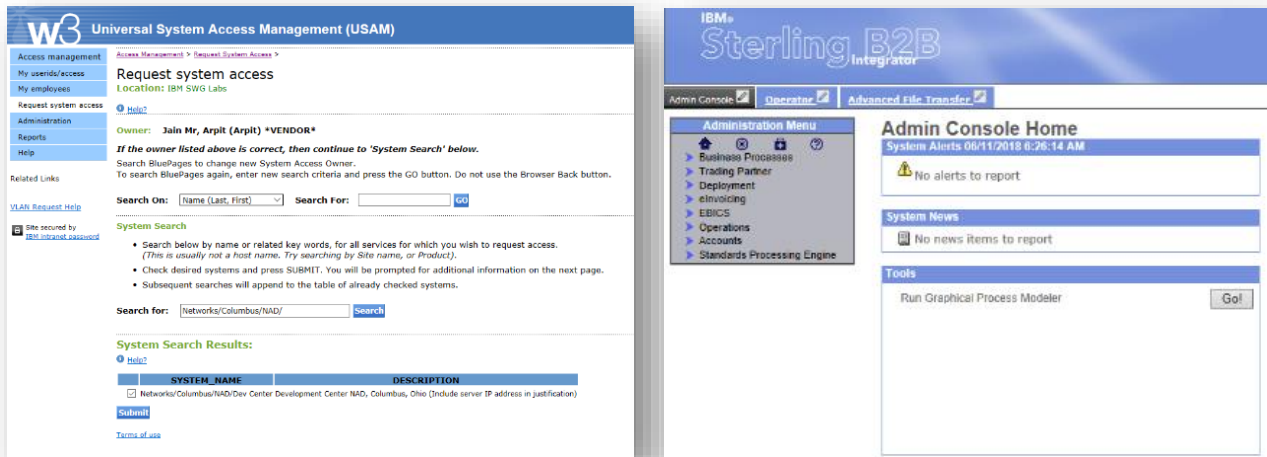

During this duration, I researched and studied about these topics and gave a presentation meeting to the entire B2B Team regarding my study and findings. Following is the link to the presentation I delivered.

## Task 2: Getting access to the B2B sterling Integrator server

To work on the B2B Sterling Integrator product, access to the servers of IBM on which the product is currently deployed and is running live was to be acquired. The access to the servers and the B2B project team was requested and was granted within a week.

## Task 3: Microservice Demo application

To demonstrate the usage of Microservices architecture for better application design, I implemented a two-microservice application. One microservice acted as a Backend API Fibonacci microservice which was called by another microservice which acted as an UI.

## Task 4: Deploying a sample WAR file on the B2B SI server

B2B Sterling Integrator works on the basis of Business processes. These business processes are used to automate the operation of the services in the business environment. There is a basic set of base services which form the core of the SI product. These services are written in Java and are pre-packaged altogether in a WAR archive format. To execute and test these services, the B2Bi WAR file is to be deployed on the SI server. Before deploying the actual B2Bi WAR file, I deployed a sample WAR packaged JSP application to test out the dependencies.

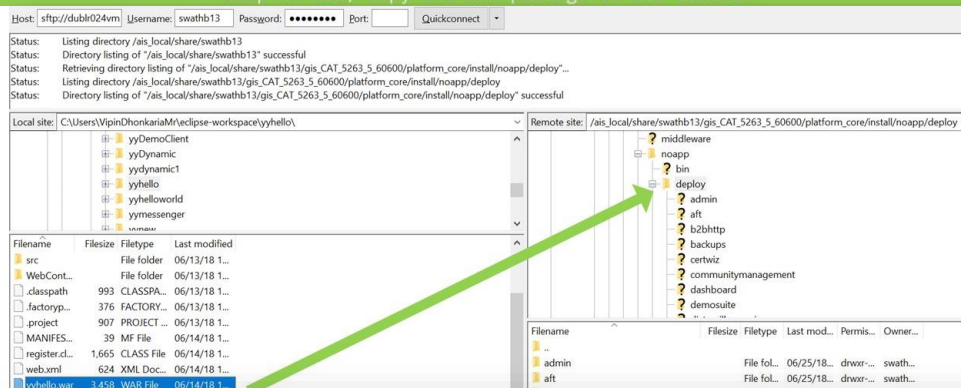

Step 1 : Create a new JSP Dynamic Web Application in Eclipse IDE

Step 2 : Code the application and then Export it as an WAR file

Step 3 : Connect to the B2Bi-SI server using Filezilla.

Step 4: Now, copy the WAR package to the server.

Step 5 : Edit the Http Server Adapter service of B2Bi-SI.

Step 6: Add an endpoint to the WAR file.

Step 7 : Wait for 10-15 Minutes so that the application is deployed.  
Step 8: Go to the endpoint URI and check if the application is running.

The screenshot shows two browser windows. The top window displays a 'Sample Registration Form' with fields for First Name (Vipin), Last Name (Dhonkaria), UserName (admin), Password (admin123), Address (IBM EGL D Block), and Contact No (4567890-9876). A green 'Request Form' button is on the right. The bottom window shows the 'Response' page with a green 'Response' button. The response text reads: 'Welcome User!!!!', 'Hey user.! Welcome to connect to IBM B@B Sterling integrator', and a list of user details: 'FirstName: Vipin', 'LastName: Dhonkaria', 'UserName: admin', 'Password: admin123', 'Address: IBM EGL D Block', and 'Contact: 4567890-9876'.

## Results and Discussions

Microservices are an effective and fault-tolerant manner of designing and developing an application. B2Bi is a large monolithic application which needs to be divided into microservices. The heart of B2Bi is composed of several business processes which are used to automate the operation of B2B services (Mailbox, Invoice, Order; etc). Separate microservices can be deployed on the B2B SI platform server to enhance its functionality.

There are several ways of deploying a service on B2B Sterling Integrator (Deploying WAR, manually by creating Java and xml service description files; etc). Through the procedure of deployment of this WAR file discovered by me, my team would be able to deploy B2Bi services which were causing build issues on deployment since last few months.

## Conclusions

During past few weeks, I got acquainted to the Microservice architecture of software development, researched about the B2B processes and learned to code them. For implementing these ideas into practical uses, I had to understand about how the Sterling Integrator code functions. Using this knowledge, I deployed a sample WAR service to the server of Sterling Integrator.

### Next Target

My target for the next 15 days is to understand the Sterling Integrator WAR deployment procedure on the SI local server. My primary aim would be to deploy a B2Bi Services packaged WAR file on the Sterling Integrator Server. After deployment, I would experiment and play around with all the APIs that B2Bi offers.
